A SAVING OF \$15,000 PER HOME!*

INEX>WEATHERBOARD™ is a revolutionary, low carbon, high strength, yet lightweight cement based exterior wall cladding that carries a fire rating level of more than twice that of BAL-FZ.

When A-Grade Constructions were contracted to build two new dwellings in Winmalee to replace those properties that were destroyed by the October 2013 Blue Mountains bushfires they selected **INEX>WEATHERBOARD™**. Both sites were assessed to be Bushfire Attack Level – Flame Zone (BAL-FZ) which is the most extreme zone within the standard.

The owners' wanted to retain the previous weatherboard finish to their new homes. **INEX>WEATHERBOARD™** was chosen

as it represented the best and most affordable solution.

As **INEX>WEATHERBOARD™** **DOES NOT NEED ANY FIRE RATED PLASTERBOARD** to achieve BAL-FZ it can be fixed directly to the timber or steel frame.

*As each new house required 250m² of weatherboard, A-Grade Constructions estimated that the build cost was reduced by about **\$15,000 FOR EACH HOME** by using **INEX>WEATHERBOARD™** compared to other conventional weatherboard alternatives.
